In this lecture we will go over examples and properties of polynomials as well as their graphs.

In this lecture we will go over examples and properties of polynomials as well as their graphs.

Definition

A **polynomial** $P(x)$ in a single variable (indeterminate) x is an expression of (*possibly after substitution of variable*) the form

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0,$$

where a_0, a_1, \dots, a_n are numbers, $n \geq 0$ and $a_n \neq 0$.

In this lecture we will go over examples and properties of polynomials as well as their graphs.

Definition

A **polynomial** $P(x)$ in a single variable (indeterminate) x is an expression of (*possibly after substitution of variable*) the form

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0,$$

where a_0, a_1, \dots, a_n are numbers, $n \geq 0$ and $a_n \neq 0$. The number n is called the **degree** of $P(x)$ and is denoted by $\deg(P)$.

In this lecture we will go over examples and properties of polynomials as well as their graphs.

Definition

A **polynomial** $P(x)$ in a single variable (indeterminate) x is an expression of (*possibly after substitution of variable*) the form

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0,$$

where a_0, a_1, \dots, a_n are numbers, $n \geq 0$ and $a_n \neq 0$. The number n is called the **degree** of $P(x)$ and is denoted by $\deg(P)$.

Interesting fact: the word polynomial joins two diverse roots: the Greek poly, meaning "many", and the Latin nomen, or "name".

- $\deg(PQ) = \deg(P) + \deg(Q)$.

Definition

A number a is called a zero of a function f if $f(a) = 0$.

Example

The zeros of polynomial $p(x) = x^2 - 4x + 3$ are 1 and 3:

Zeros of a polynomial

We conclude that

- $\deg(P \pm Q) \leq \max(\deg(P), \deg(Q))$;
- $\deg(PQ) = \deg(P) + \deg(Q)$.

Definition

A number a is called a zero of a function f if $f(a) = 0$.

Example

The zeros of polynomial $p(x) = x^2 - 4x + 3$ are 1 and 3:

- $p(1) = 1^2 - 4 \cdot 1 + 3 = 1 - 4 + 3 = 0$ and

Zeros of a polynomial

We conclude that

- $\deg(P \pm Q) \leq \max(\deg(P), \deg(Q))$;
- $\deg(PQ) = \deg(P) + \deg(Q)$.

Definition

A number a is called a zero of a function f if $f(a) = 0$.

Example

The zeros of polynomial $p(x) = x^2 - 4x + 3$ are 1 and 3:

- $p(1) = 1^2 - 4 \cdot 1 + 3 = 1 - 4 + 3 = 0$ and
- $p(3) = 3^2 - 4 \cdot 3 + 3 = 9 - 12 + 3 = 0$.

Zeros of a polynomial

We conclude that

- $\deg(P \pm Q) \leq \max(\deg(P), \deg(Q))$;
- $\deg(PQ) = \deg(P) + \deg(Q)$.

Definition

A number a is called a zero of a function f if $f(a) = 0$.

Example

The zeros of polynomial $p(x) = x^2 - 4x + 3$ are 1 and 3:

- $p(1) = 1^2 - 4 \cdot 1 + 3 = 1 - 4 + 3 = 0$ and
- $p(3) = 3^2 - 4 \cdot 3 + 3 = 9 - 12 + 3 = 0$.

Theorem

*Let $p(x)$ be a polynomial, then a is a zero of p if and only if $x - a$ is a **factor** of p , i.e. $p(x) = (x - a)q(x)$ for some polynomial $q(x)$ (notice that $\deg(q) = \deg(p) - 1$).*

Remark

The number of zeros of a nonzero polynomial $p(x)$ is less than or equal to $\deg(p)$.

The behavior of a polynomial $p(x)$ for very large positive or negative values of x is determined by its **leading term** (monomial with exponent equal to the degree of p). Let $p(x)$ be a polynomial and $n = \deg(p)$. The table below describes possible behavior types of $p(x)$.

| | n is even, $a_n > 0$ | n is even, $a_n < 0$ | n is odd, $a_n > 0$ | n is odd, $a_n < 0$ |
|-------------------------|---------------------------|----------------------------|----------------------------|----------------------------|
| $x \rightarrow \infty$ | $P(x) \rightarrow \infty$ | $P(x) \rightarrow -\infty$ | $P(x) \rightarrow \infty$ | $P(x) \rightarrow -\infty$ |
| $x \rightarrow -\infty$ | $P(x) \rightarrow \infty$ | $P(x) \rightarrow -\infty$ | $P(x) \rightarrow -\infty$ | $P(x) \rightarrow \infty$ |

Example

Consider the polynomial $p(x) = 3 - 8x^2 - 10x^5$. The leading term of p is $-10x^5$ with the leading coefficient $-10 < 0$. We conclude that $p(x) \rightarrow -\infty$ as $x \rightarrow \infty$ and $p(x) \rightarrow \infty$ as $x \rightarrow -\infty$.

Question

Consider the polynomial $q(x) = 2x^4 - 8 + 9x^6 - x^3$.

Question

Consider the polynomial $q(x) = 2x^4 - 8 + 9x^6 - x^3$.

- 1 What is the degree of $q(x)$?

Question

Consider the polynomial $q(x) = 2x^4 - 8 + 9x^6 - x^3$.

- 1 What is the degree of $q(x)$?
- 2 What is the leading coefficient of $q(x)$?

Question

Consider the polynomial $q(x) = 2x^4 - 8 + 9x^6 - x^3$.

- 1 What is the degree of $q(x)$?
- 2 What is the leading coefficient of $q(x)$?
- 3 What happens to $q(x)$ as x approaches ∞ ?

Question

Consider the polynomial $q(x) = 2x^4 - 8 + 9x^6 - x^3$.

- 1 What is the degree of $q(x)$?
- 2 What is the leading coefficient of $q(x)$?
- 3 What happens to $q(x)$ as x approaches ∞ ?

Answer: the leading term of $q(x)$ is the monomial $9x^6$. It follows that $\deg(q) = 6$, the leading coefficient is 9 and $q(x) \rightarrow \infty$ when $x \rightarrow \infty$.
