$x \rightarrow -\infty$	$f(x) \rightarrow \alpha x^s \rightarrow \pm\infty$	$f(x) \rightarrow \alpha$	$f(x) \rightarrow 0$

## Definition

A line is called an **asymptote** if the distance between the graph of  $f(x)$  and the line approaches zero as one or both of the  $x$  or  $y$  coordinates tends to infinity.

For instance, the lines  $y = \alpha$  and  $y = 0$  appearing in the table above are (horizontal) asymptotes.

## Example

- $f(x) = \frac{27 - x^3}{(10 + x)(2x + 5)}$ . The ratio of leading terms is  $\frac{-x^3}{2x^2} = -0.5x$  and  $\deg(p) = 3 > 2 = \deg(q)$ .

## Example

- $f(x) = \frac{27 - x^3}{(10 + x)(2x + 5)}$ . The ratio of leading terms is  $\frac{-x^3}{2x^2} = -0.5x$  and  $\deg(p) = 3 > 2 = \deg(q)$ . As  $x \rightarrow \pm\infty$ , we get  $f(x) \rightarrow \mp\infty$ .

## Example

- $f(x) = \frac{27 - x^3}{(10 + x)(2x + 5)}$ . The ratio of leading terms is  $\frac{-x^3}{2x^2} = -0.5x$  and  $\deg(p) = 3 > 2 = \deg(q)$ . As  $x \rightarrow \pm\infty$ , we get  $f(x) \rightarrow \mp\infty$ .
- $f(x) = \frac{x^2 - 7}{(10 - x)(3x + 5)}$ . The ratio of leading terms is  $\frac{x^2}{-3x^2} = -\frac{1}{3}$  and  $\deg(p) = \deg(q) = 2$ .

## Example

- $f(x) = \frac{27 - x^3}{(10 + x)(2x + 5)}$ . The ratio of leading terms is  $\frac{-x^3}{2x^2} = -0.5x$  and  $\deg(p) = 3 > 2 = \deg(q)$ . As  $x \rightarrow \pm\infty$ , we get  $f(x) \rightarrow \mp\infty$ .
- $f(x) = \frac{x^2 - 7}{(10 - x)(3x + 5)}$ . The ratio of leading terms is  $\frac{x^2}{-3x^2} = -\frac{1}{3}$  and  $\deg(p) = \deg(q) = 2$ . As  $x \rightarrow \infty$  or  $x \rightarrow -\infty$ , we get  $f(x) \rightarrow -\frac{1}{3}$  and the line  $y = -\frac{1}{3}$  is a horizontal asymptote of  $f(x)$ .

## Question

What is the horizontal asymptote of the graph of the rational function  $h(x) = \frac{(5-x)(2x^2+7)}{7x-4x^3}$ ?

## Question

What is the horizontal asymptote of the graph of the rational function  $h(x) = \frac{(5-x)(2x^2+7)}{7x-4x^3}$ ?

**Answer:** the degrees of the polynomials in numerator and denominator are both equal to three. The leading terms are  $-2x^3$  and  $-4x^3$ , hence, the ratio of leading coefficients is  $\alpha = \frac{-2}{-4} = 0.5$ . The horizontal asymptote is the line  $y = 0.5$ .
