Inverse
functions

Definition

A function g is called the **inverse** of a function f if $(f \circ g)(x) = x$ (and automatically $(g \circ f)(x) = x$). The inverse of f is denoted by f^{-1} .

Inverse
functions

Definition

A function g is called the **inverse** of a function f if $(f \circ g)(x) = x$ (and automatically $(g \circ f)(x) = x$). The inverse of f is denoted by f^{-1} .

Remark

The inverse of a function is **NOT** the multiplicative inverse, in other words,

$$f^{-1} \neq \frac{1}{f}.$$

Example

The formula for converting the temperature from Celsius to Fahrenheit is $F(x) = \frac{9}{5}x + 32$. We would like to find the formula for converting 'backwards': from Fahrenheit to Celsius.

Example

The formula for converting the temperature from Celsius to Fahrenheit is $F(x) = \frac{9}{5}x + 32$. We would like to find the formula for converting 'backwards': from Fahrenheit to Celsius.

Said differently, we would like to find the function $C(x)$ with $F(C(x)) = x$ (since conversion from Fahrenheit to Celsius and then back to Fahrenheit should give the initial value).

Example

The formula for converting the temperature from Celsius to Fahrenheit is $F(x) = \frac{9}{5}x + 32$. We would like to find the formula for converting 'backwards': from Fahrenheit to Celsius.

Said differently, we would like to find the function $C(x)$ with $F(C(x)) = x$ (since conversion from Fahrenheit to Celsius and then back to Fahrenheit should give the initial value).

Let's denote $C(x)$ by a dummy variable y . Then we need to find y from the equation $F(y) = \frac{9}{5}y + 32 = x$.

Example

This can be done via the following sequence of algebraic transformations:

Example

This can be done via the following sequence of algebraic transformations:

$$\frac{9}{5}y + 32 = x \Leftrightarrow \frac{9}{5}y = x - 32 \Leftrightarrow y = \frac{5}{9}(x - 32).$$

Example

This can be done via the following sequence of algebraic transformations:

$$\frac{9}{5}y + 32 = x \Leftrightarrow \frac{9}{5}y = x - 32 \Leftrightarrow y = \frac{5}{9}(x - 32).$$

Therefore, $C(x) = \frac{5}{9}(x - 32)$.

Example

This can be done via the following sequence of algebraic transformations:

$$\frac{9}{5}y + 32 = x \Leftrightarrow \frac{9}{5}y = x - 32 \Leftrightarrow y = \frac{5}{9}(x - 32).$$

Therefore, $C(x) = \frac{5}{9}(x - 32)$.

We can (and should) check that the functions F and C are indeed inverse:

Example

This can be done via the following sequence of algebraic transformations:

$$\frac{9}{5}y + 32 = x \Leftrightarrow \frac{9}{5}y = x - 32 \Leftrightarrow y = \frac{5}{9}(x - 32).$$

Therefore, $C(x) = \frac{5}{9}(x - 32)$.

We can (and should) check that the functions F and C are indeed inverse:

$$C(F(x)) = \frac{5}{9} \left(\frac{9}{5}x + 32 - 32 \right) = \frac{5}{9} \cdot \frac{9}{5}x = x.$$

Question

There are two natural questions at this point.

Question

There are two natural questions at this point.

- 1 For which functions f does the inverse function f^{-1} exist?

Question

There are two natural questions at this point.

- 1 For which functions f does the inverse function f^{-1} exist?
- 2 How can we find a formula for f^{-1} (provided it exists)?

Question

There are two natural questions at this point.

- 1 For which functions f does the inverse function f^{-1} exist?
- 2 How can we find a formula for f^{-1} (provided it exists)?

Example

Consider the function $f(x) = x^2$, then $f(1) = 1^2 = 1$, but $f(-1) = (-1)^2 = 1$ as well. If f^{-1} existed then what would $f^{-1}(1)$ be equal to? Recall that f^{-1} is a function, so we can not have $f^{-1}(1) = \{1, -1\}$. Therefore, the function $f(x) = x^2$ does not have an inverse.

One-to-one functions

Lecture 6

MATH 0200

Inverse
functions

Definition

A function f is called **one-to-one** if for any numbers $a \neq b$ in the domain of f , one has $f(a) \neq f(b)$.

One-to-one functions

Lecture 6

MATH 0200

Inverse
functions

Definition

A function f is called **one-to-one** if for any numbers $a \neq b$ in the domain of f , one has $f(a) \neq f(b)$.

Remark

A function f is one-to-one if and only if any horizontal line $y = c$ intersects the graph in at most one point. This statement is known as the **horizontal line test**.

Inverse
functions

Definition

A function f is called **one-to-one** if for any numbers $a \neq b$ in the domain of f , one has $f(a) \neq f(b)$.

Remark

A function f is one-to-one if and only if any horizontal line $y = c$ intersects the graph in at most one point. This statement is known as the **horizontal line test**.

Remark

A function f is invertible if and only if it is one-to-one.

Example

The function $f(x)$ below is not one-to-one.

Finding inverse functions

Lecture 6

MATH 0200

Inverse
functions

Next we provide a 3-step recipe for finding the inverse.

Finding inverse functions

Lecture 6

MATH 0200

Inverse
functions

Next we provide a 3-step recipe for finding the inverse.

Step 1. Write $y = f(x)$.

Finding inverse functions

Lecture 6

MATH 0200

Inverse
functions

Next we provide a 3-step recipe for finding the inverse.

Step 1. Write $y = f(x)$.

Step 2. Find x as a function of y .

Finding inverse functions

Lecture 6

MATH 0200

Inverse
functions

Next we provide a 3-step recipe for finding the inverse.

Step 1. Write $y = f(x)$.

Step 2. Find x as a function of y .

Step 3. Substitute x by $f^{-1}(x)$ and y by x to obtain a formula for the inverse function.

Example

Find the inverse of the function $f(x) = \frac{1-x}{3+x}$.

Example

Find the inverse of the function $f(x) = \frac{1-x}{3+x}$.

① $y = \frac{1-x}{3+x}$.

Example

Find the inverse of the function $f(x) = \frac{1-x}{3+x}$.

$$\textcircled{1} \quad y = \frac{1-x}{3+x}.$$

$$\textcircled{2} \quad y = \frac{1-x}{3+x} \Leftrightarrow (3+x)y = 1-x \Leftrightarrow 3y + xy = 1-x \Leftrightarrow$$
$$xy + x = 1 - 3y \Leftrightarrow x(y+1) = 1 - 3y \Leftrightarrow x = \frac{1-3y}{y+1}.$$

Example

Find the inverse of the function $f(x) = \frac{1-x}{3+x}$.

$$\textcircled{1} \quad y = \frac{1-x}{3+x}.$$

$$\textcircled{2} \quad y = \frac{1-x}{3+x} \Leftrightarrow (3+x)y = 1-x \Leftrightarrow 3y + xy = 1-x \Leftrightarrow$$

$$xy + x = 1 - 3y \Leftrightarrow x(y+1) = 1 - 3y \Leftrightarrow x = \frac{1-3y}{y+1}.$$

$$\textcircled{3} \quad \text{We get } f^{-1}(x) = \frac{1-3x}{x+1}.$$

$$\text{We check: } f^{-1} \circ f(x) = \frac{1 - 3 \cdot \frac{1-x}{3+x}}{\frac{1-x}{3+x} + 1} = \frac{3+x - (3-3x)}{1-x+3+x} = \frac{3+x - (3-3x)}{3+x} =$$

$$\frac{\frac{x+3x}{3+x}}{\frac{4}{3+x}} = \frac{4x}{4} = x \quad \checkmark$$

Properties and graphs of inverse functions

Lecture 6

MATH 0200

Inverse
functions

① Domain of $f = \text{range of } f^{-1}$.

Properties and graphs of inverse functions

Inverse
functions

- 1 Domain of f = range of f^{-1} .
- 2 Range of f = domain of f^{-1} .
- 3 The graphs of f and f^{-1} are symmetric with respect to the line $y = x$.

Example

Question

Let $f(x)$ be given by the table below

x	$f(x)$
-2	3
0	1
3	-2

What are the range of f^{-1} and the value of $f^{-1}(-2)$?
