

# Section 11.1

---

## Introduction to Trees

## Definition:

---

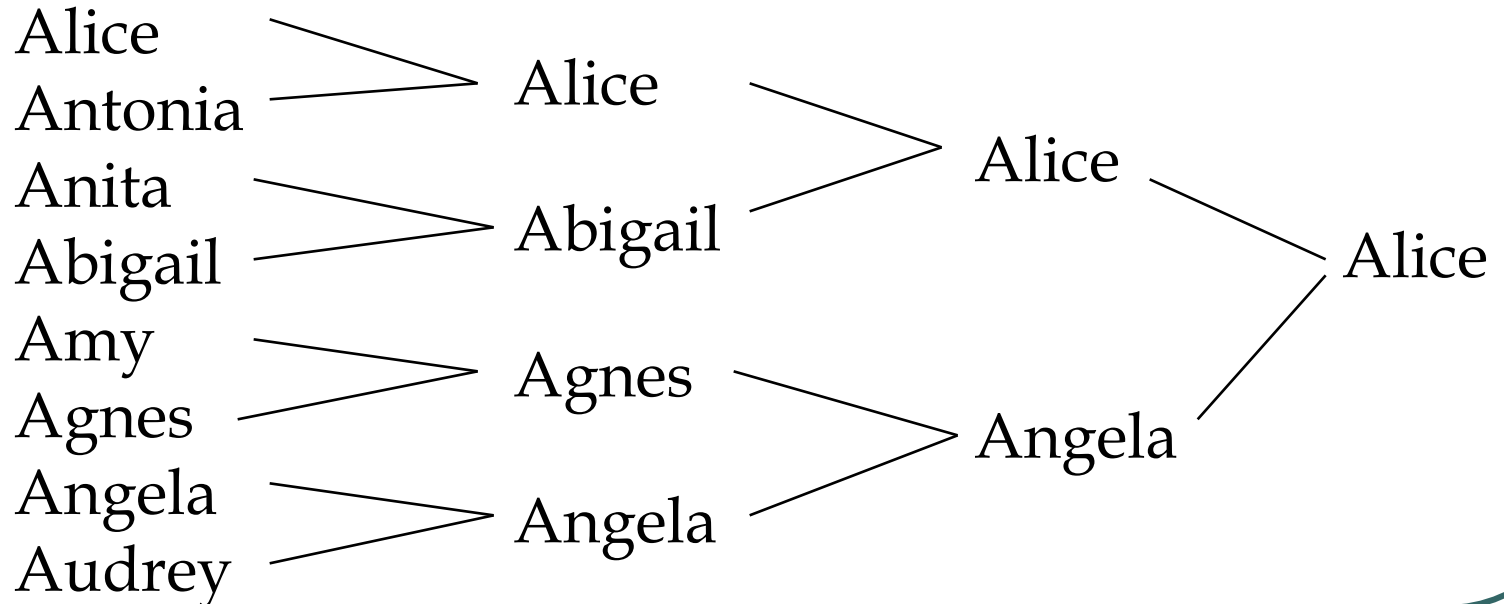

A *tree* is a connected undirected graph with no simple circuits.

: A **circuit** is a path of length  $\geq 1$  that begins and ends at the same vertex.

# Tournament Trees

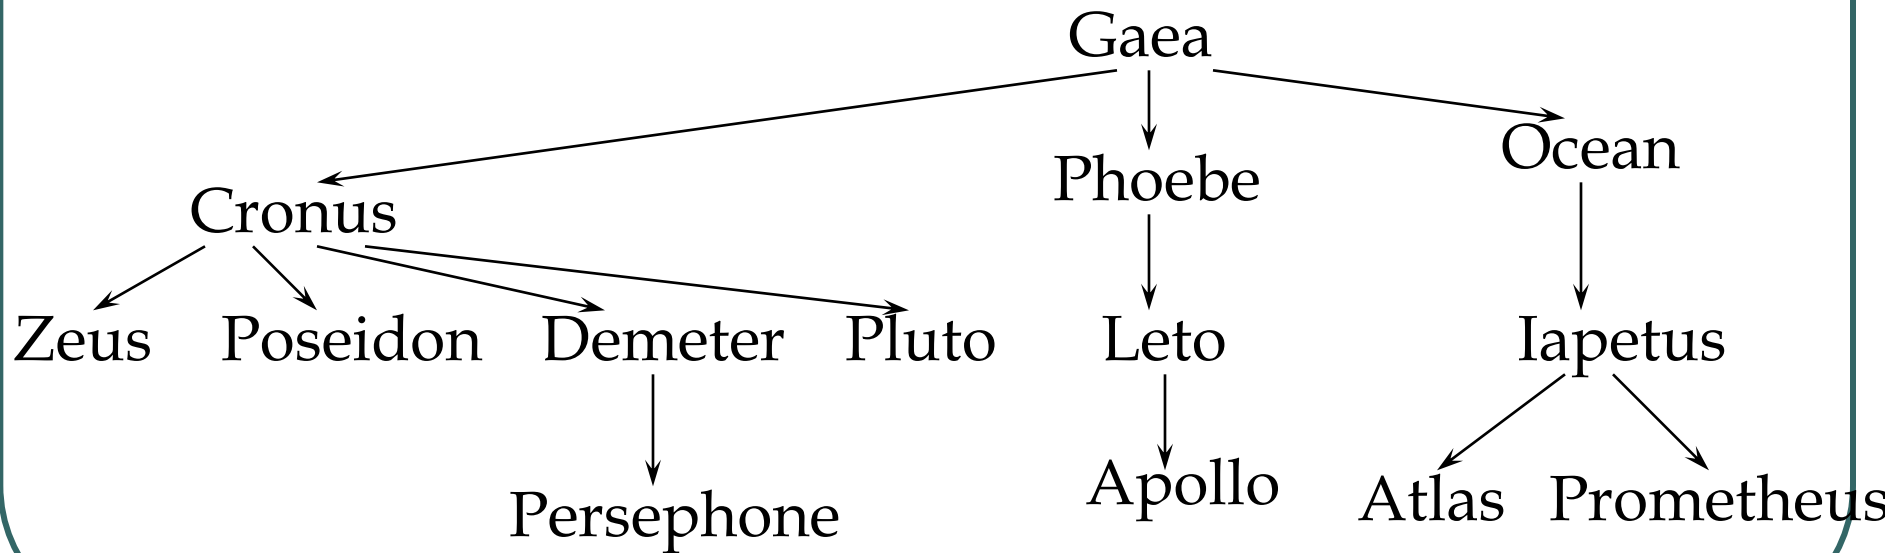

A common form of tree used in everyday life is the tournament tree, used to describe the outcome of a series of games, such as a tennis tournament.

# A Family Tree

---

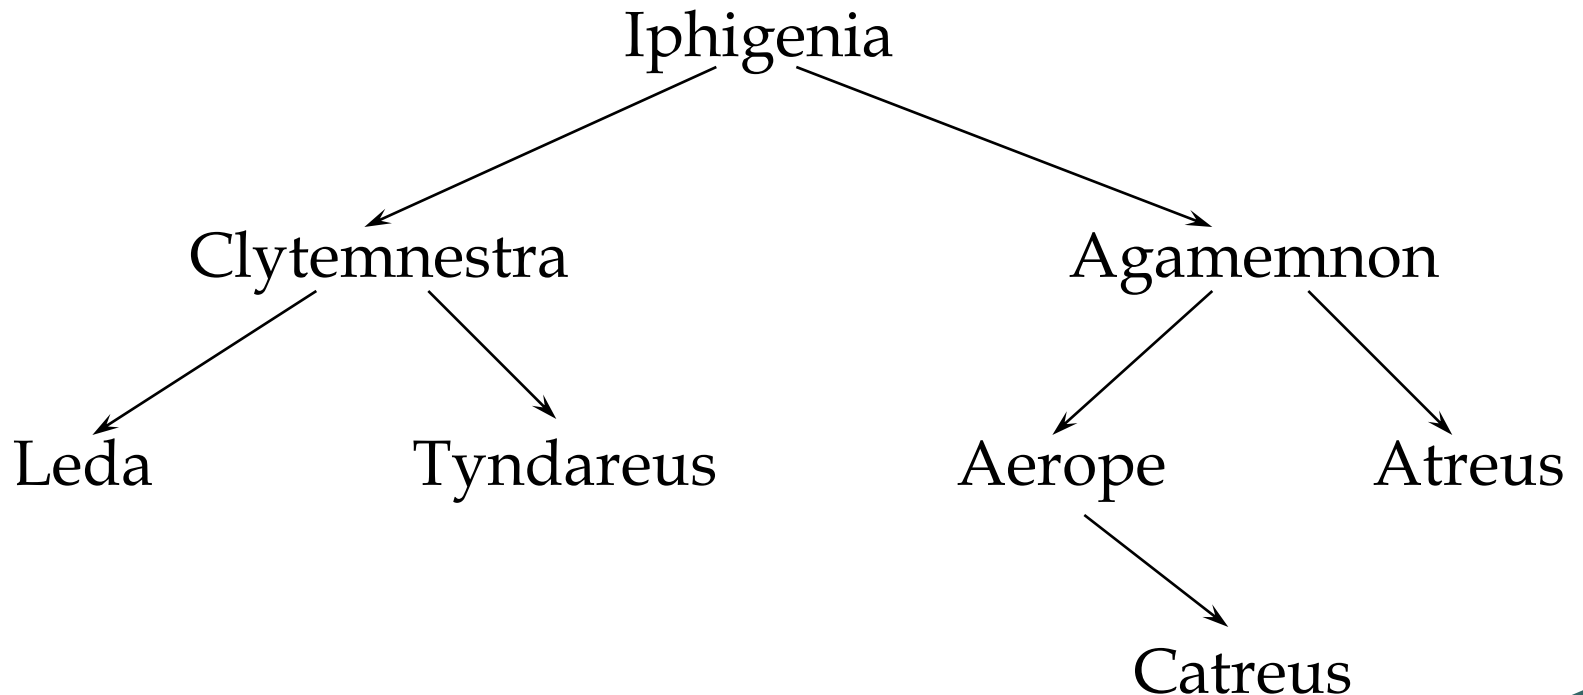

Much of the tree terminology derives from family trees.

# Ancestor Tree

---

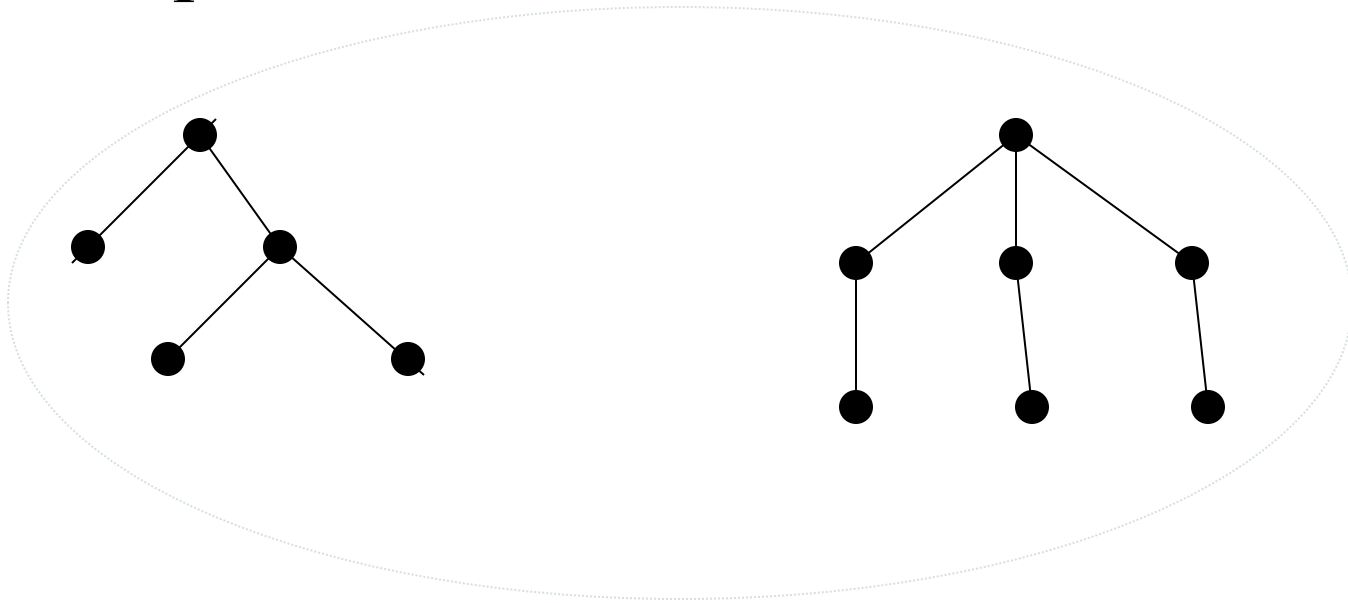

An inverted family tree. Important point - it is a *binary* tree.

# Forest

---

Graphs containing no simple circuits that are not connected, but each connected component is a tree.

# Theorem

---

An undirected graph is a tree if and only if there is a unique simple path between any two of its vertices.

## Rooted Trees

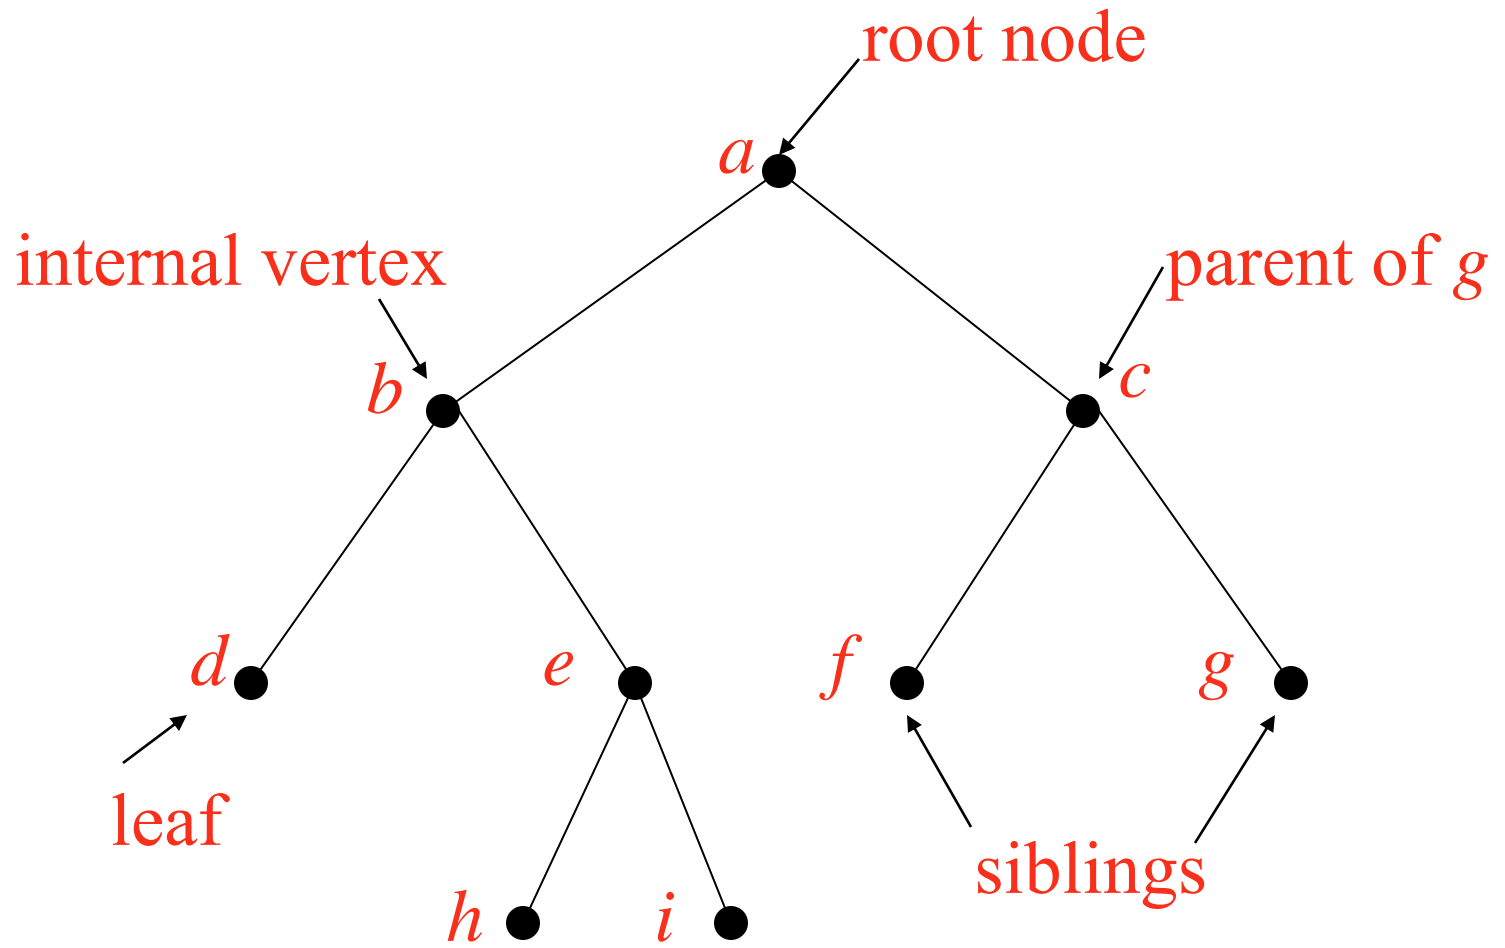

---

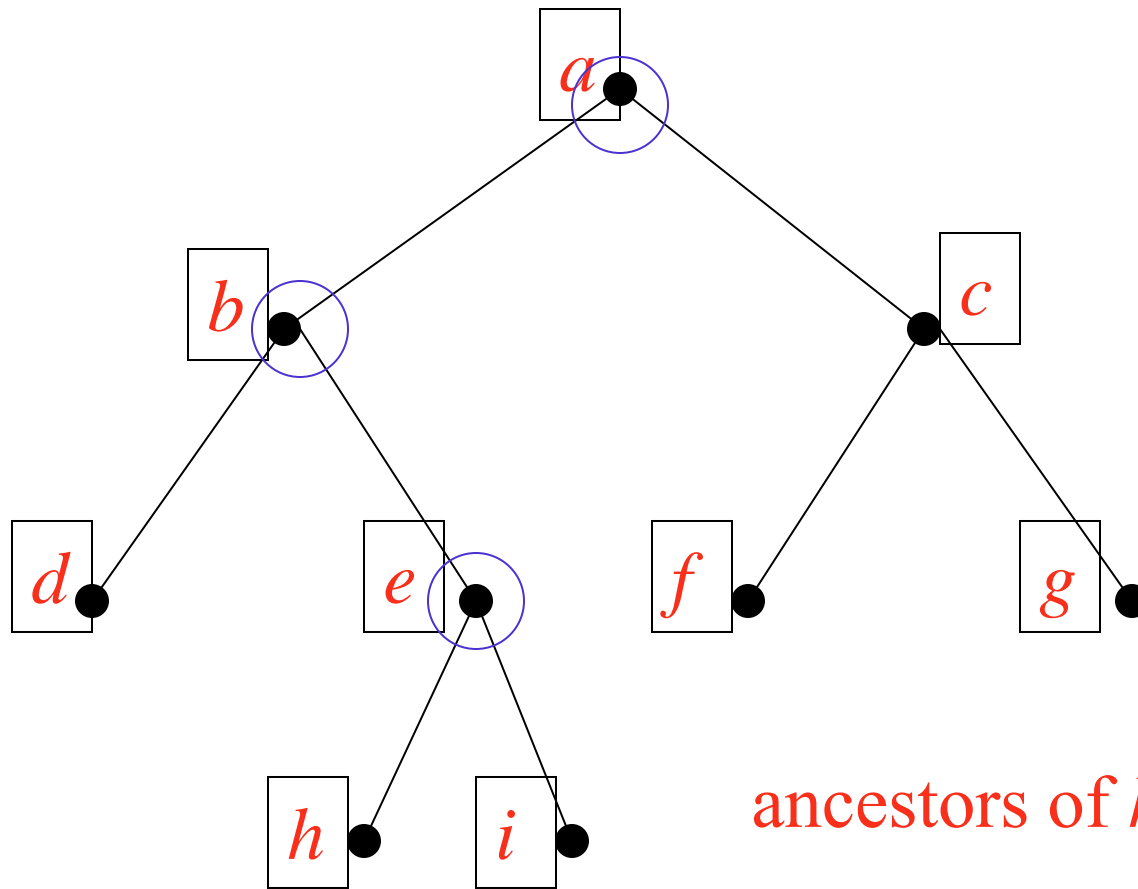

Once a vertex of a tree has been designated as the *root* of the tree, it is possible to assign direction to each of the edges.

# Rooted Trees

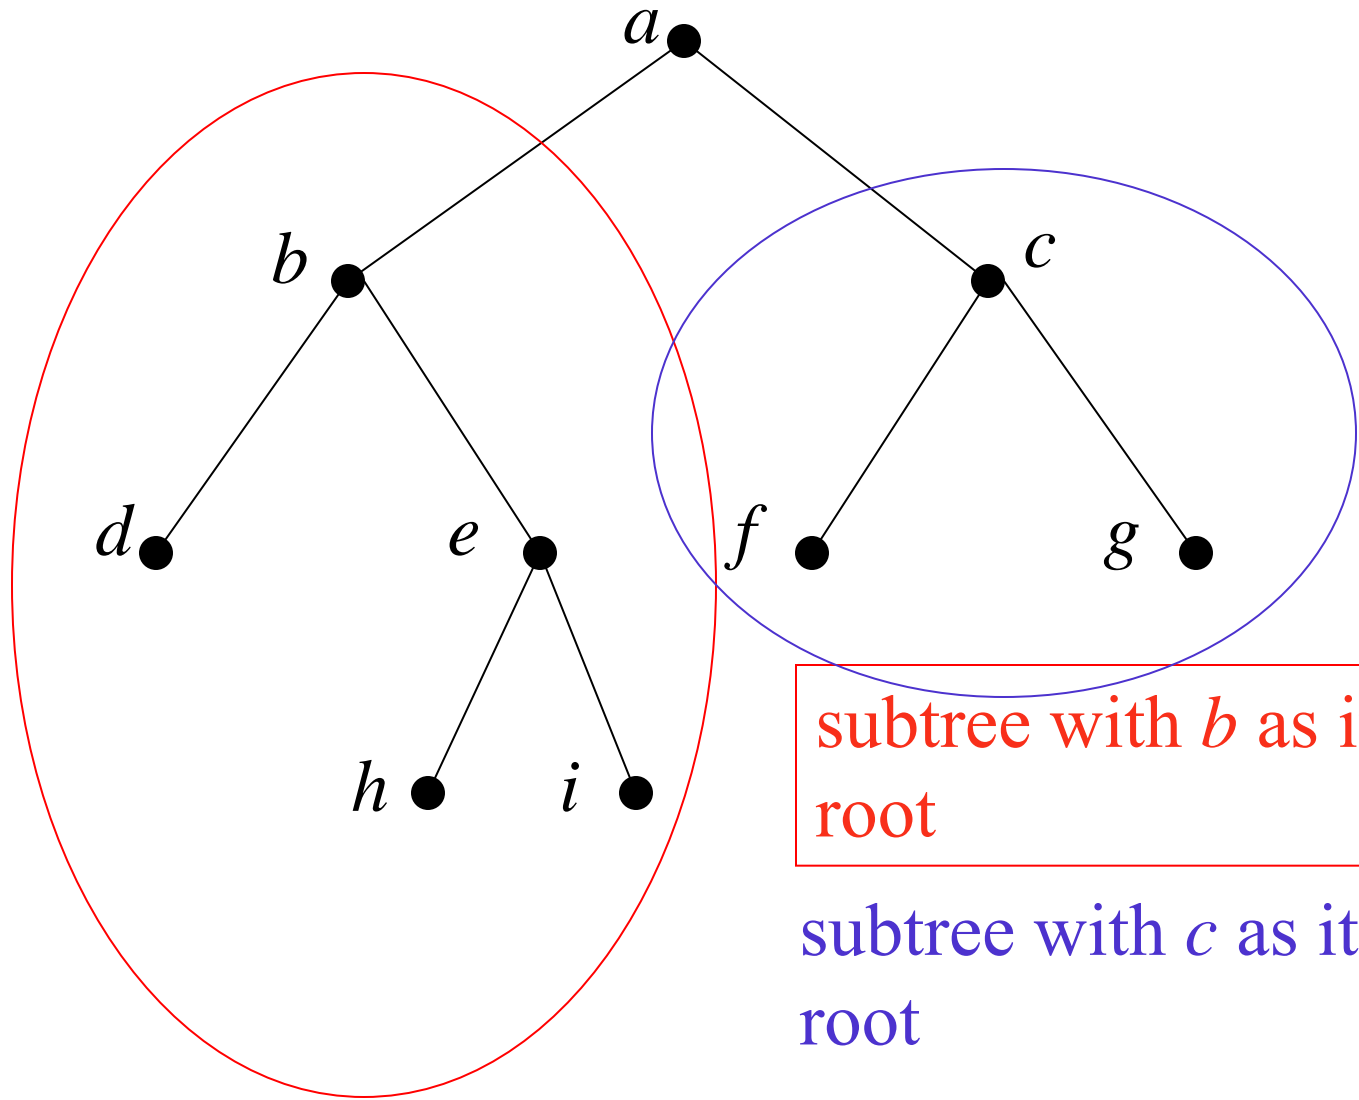

---

ancestors of *h* and *i*

subtree with  $b$  as its root

subtree with  $c$  as its root

## ***m*-ary trees**

---

A rooted tree is called an *m*-ary tree if every internal vertex has no more than *m* children. The tree is called a *full m*-ary tree if every internal vertex has exactly *m* children. An *m*-ary tree with  $m=2$  is called a *binary tree*.

# Ordered Rooted Tree

---

An ordered rooted tree is a rooted tree where the children of each internal vertex are ordered. Ordered trees are drawn so that the children of each internal vertex are shown in order from left to right.

# Properties of Trees

---

A tree with  $n$  vertices has  $n-1$  edges.

# Properties of Trees

---

A full  $m$ -ary tree with  $i$  internal vertices contains  $n = mi + 1$  vertices.

# Properties of Trees

---

A full  $m$ -ary tree with

(i)  $n$  vertices has  $i = (n-1)/m$  internal vertices and  $l = [(m-1)n+1]/m$  leaves.

(ii)  $i$  internal vertices has  $n = mi + 1$  vertices and  $l = (m-1)i + 1$  leaves.

(iii)  $l$  leaves has  $n = (ml - 1)/(m-1)$  vertices and  $i = (l-1)/(m-1)$  internal vertices.

## Proof

---

- We know  $n = mi+1$  (previous theorem) and  $n = l+i$ ,
- $n$  – no. vertices
- $i$  – no. internal vertices
- $l$  – no. leaves
- For example,  $i = (n-1)/m$

# Properties of Trees

---

The level of a vertex  $v$  in a rooted tree is the length of the unique path from the root to this vertex.

# Properties of Trees

---

The *height* of a rooted tree is the maximum of the levels of vertices.

# Properties of Trees

---

A rooted  $m$ -ary tree of height  $h$  is called *balanced* if all leaves are at levels  $h$  or  $h-1$ .

# Properties of Trees

---

There are at most  $m^h$  leaves in an  $m$ -ary tree of height  $h$ .

# Properties of Trees

---

If an  $m$ -ary tree of height  $h$  has  $l$  leaves, then  $h \geq \lceil \log_m l \rceil$

## Proof

---

- From previous theorem:

$$l \leq m^h \Rightarrow \log_m l \leq h \Rightarrow \lceil \log_m l \rceil \leq h$$
