Elementary Statistics: Looking at the Big Picture

1

Definition

z-score, or **standardized value**, tells how many standard deviations below or above the mean the original value *x* is:

$$z = \frac{\text{value-mean}}{\text{standard deviation}}$$

- □ Notation:
 - Sample: $z = \frac{x \bar{x}}{s}$
 - Population: $z = \frac{x-\mu}{\sigma}$
- □ **Unstandardizing** *z*-scores:

Original value *x* can be computed from *z*-score.

Take the mean and add z standard deviations:

$$x = \mu + z\sigma$$

L6.3

Looking Back: Review

- **□** 4 Stages of Statistics
 - Data Production (discussed in Lectures 1-4)
 - Displaying and Summarizing
 - □ Single variables: 1 cat. (Lecture 5), 1 quantitative
 - □ Relationships between 2 variables
 - Probability
 - Statistical Inference

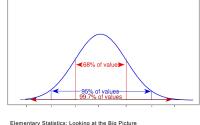

©2011 Brooks/Cole Cengage Learning Elementary Statistics: Looking at the Big Picture

L6.2

2

Example: 68-95-99.7 Rule for z

- **Background:** The 68-95-99.7 Rule applies to any normal distribution.
- **Question:** What does the Rule tell us about the distribution of standardized normal scores *z*?
- **Response:** Sketch a curve with mean___, standard deviation :

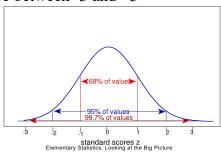

©2011 Brooks/Cole, Cengage Learning

lementary Statistics: Looking at the Big Picture

68-95-99.7 Rule for *z*-scores

For distribution of standardized normal values z,

- 3 68% are between -1 and +1
- \square 95% are between -2 and +2
- \square 99.7% are between -3 and +3

Cengage Lear

7

Interpreting z-scores

This table classifies ranges of *z*-scores informally, in terms of being unusual or not.

| Size of z | Unusual? |
|-------------------------|--|
| z greater than 3 | extremely unusual |
| z between 2 and 3 | very unusual |
| z between 1.75 and 2 | unusual |
| z between 1.5 and 1.75 | maybe unusual (depends on circumstances) |
| z between 1 and 1.5 | somewhat low/high, but not unusual |
| z less than 1 | quite common |
| | |
| | |

Elementary Statistics: Looking at the Big Picture

L6.10

Example: What z-scores Tell Us

- **Background:** On an exam (normal), two students' z-scores are -0.4 and +1.5.
- **Question:** How should they interpret these?
- **□** Response:
 - -0.4: ____
 - +1.5:

Example: Calculating and Interpreting z

- **Background:** Molar lengths (mm) for 3 species are normal:
 - Paranthropus Boisei mean 11.5, standard deviation 0.8
 - Early homo erectus: mean 7.8, standard deviation 0.7
 - Early homo: mean 9.3, standard deviation 0.6
- Question: Anthropologists discovered a 9.7 mm molar. What's our best guess of which species it came from?
- □ Response:
 - Paranthropus Boisei:
 - Early h. erectus:
 - Early homo:

mentary Statistics: Looking at the Big Pictu

Practice: 4.48b p.119

Example: z Score in Life-or-Death Decision

- **Background:** IQs are normal; mean=100, sd=15. In 2002, Supreme Court ruled that execution of mentally retarded is cruel and unusual punishment, violating Constitution's 8th Amendment.
- **Questions:** A convicted criminal's IQ is 59. Is he borderline or well below the cut-off for mental retardation? Is the death penalty appropriate?
- **Response:** His z-score is

©2011 Brooks/Cole

Elementary Statistics: Looking at the Big Picture Practice: 4.55f p. 121

14

Definition (Review)

z-score, or **standardized value**, tells how many standard deviations below or above the mean the original value x is:

$$z = \frac{\text{value-mean}}{\text{standard deviation}}$$

- Notation:
- Sample: $z = \frac{x \bar{x}}{s}$
- Population: $z = \frac{x-\mu}{\sigma}$
- □ **Unstandardizing** *z*-scores:

Original value x can be computed from z-score.

Take the mean and add z standard deviations:

$$x = \mu + z\sigma$$

©2011 Brooks/Cole, Cengage Learning

Example: From z-score to Original Value

- **Background:** IQ's have mean 100, sd. 15.
- **Question:** What is a student's IQ, if z=+1.2?
- **Response:**

©2011 Brooks/Cole

Elementary Statistics: Looking at the Big Picture Practice: 4.48d p.119

16

Example: Negative z-score

- Background: Exams have mean 79, standard deviation 5. A student's z score on the exam is -0.4.
- **Question:** What is the student's score?
- **Response:**

If z is negative, then the value x is below average.

©2011 Brooks/Cole Cengage Learning

Elementary Statistics: Looking at the Big Picture Practice: 4.55h p.121

Example: *Unstandardizing a z-score*

- **Background:** Adult heights are normal:
 - Females: mean 65, standard deviation 2.8 (or 3)
 - Males: mean 70, standard deviation 3
- **Question:** Have a student report his or her z-score; what is his/her actual height value?
- **Response:**
 - Females: take 65+z(3)=
 - Males: take 70+z(3)=

Elementary Statistics: Looking at the Big Picture

L6.20

20

Looking Back: Review

- □ 4 Stages of Statistics
 - Data Production (discussed in Lectures 1-3)
 - Displaying and Summarizing
 - □ Single variables: 1 cat,1 quan (discussed Lectures 4-6)
 - Relationships between 2 variables:
 - Categorical and quantitative
 - Two categorical
 - Two quantitative
 - **Probability**
 - Statistical Inference

Cengage Learning

Elementary Statistics: Looking at the Big Picture

L6.23

Example: When Rule Does Not Apply

- □ **Background**: Students' computer times had mean 97.9 and standard deviation 109.7.
- **Question:** How do we know the distribution of times is not normal?
- □ Response:

©2011 Brooks/Cole

Elementary Statistics: Looking at the Big Picture Practice: 4.61a-b p.122 L6.22

22

Single Quantitative Variables (Review)

□ Display:

- Stemplot
- Histogram
- Boxplot

□ Summarize:

- Five Number Summary
- Mean and Standard Deviation

Add categorical explanatory variable → display and summary of quantitative responses are extensions of those used for single quantitative variables.

©2011 Brooks/Cole Cengage Learning

Design for Categorical/Quantitative Relationship

- Two-Sample
- Several-Sample
- Paired

Looking Ahead: Inference procedures for population relationship will differ, depending on which of the three designs was used.

©2011 Brooks/Cole, Cengage Learning Elementary Statistics: Looking at the Big Picture

L6.25

25

Example: Formats for Two-Sample Data

□ Background: Data on students' earnings includes

gender info: MaleEarnings FemaleEarnings

12 3
1 7
10 2

- **Question:** How else can we format the data?
- **□** Response:

2011 Brooks/Cole, Elementary Statistics: Looking at the Big Picture Practice: 5.2 p.144 engage Learning

L6.29

Displays and Summaries for Two-Sample Design

- □ Display: Side-by-side boxplots
 - One boxplot for each categorical group
 - Both share same quantitative scale
- □ Summarize: Compare
 - Five Number Summaries (looking at boxplots)
 - Means and Standard Deviations

Looking Ahead: Inference for population relationship will focus on means and standard deviations.

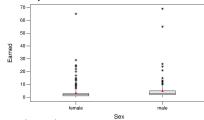

©2011 Brooks/Cole Cengage Learning Elementary Statistics: Looking at the Big Picture

L6.27

27

Example: *Display/Summarize for Two-Sample*

□ **Background**: Earnings of sampled males and females are displayed with side-by-side boxplots.

- **Question:** What do the boxplots show?
- □ Response:
 - Center:
 - Spread:
- Shape:

Cengage Learning

Elementary Statistics: Looking at the Big Picture Practice: 5.7 p.145

Example: Summaries for Two-Sample Design

□ **Background**: Earnings of sampled males and females are summarized with software:

Descriptive Statistics: Earned by Sex

| Variable | Sex | N | Mean | Median | ${\tt TrMean}$ | ${\tt StDev}$ |
|----------|--------|---------|---------|---------|----------------|---------------|
| Earned | female | 282 | 3.145 | 2.000 | 2.260 | 5.646 |
| | male | 164 | 4.860 | 3.000 | 3.797 | 7.657 |
| Variable | Sex | SE Mean | Minimum | Maximum | Q1 | QЗ |
| Earned | female | 0.336 | 0.000 | 65.000 | 1.000 | 3.000 |
| | male | 0.598 | 0.000 | 69.000 | 2.000 | 5.000 |

- **Question:** What does the output tell us?
- **Response:**
 - Centers:
 - Spreads:
 - Shapes:

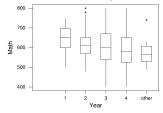

©2011 Brooks/Cole,

Elementary Statistics: Looking at the Big Picture Practice: 5.83 p.210

33

Example: Several-Sample Design

□ **Background**: Math SAT scores compared for samples of students in 5 year categories.

- **Question:** What do the boxplots show?
- **Response:**

Looking Back: (Sampling Design) Are there confounding variables/bias? These are all intro stats students...

L6.34

36

Display and Summaries for Paired Design

- □ **Display:** histogram of differences
- □ Summarize: mean and standard deviation of differences

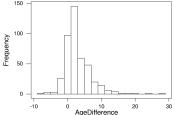

©2011 Brooks/Cole,

Elementary Statistics: Looking at the Big Picture

38

Example: Histogram of Differences

Background: Histogram of differences, father's age minus mother's age:

- **Question:** What does histogram show about relationship between parent sex and parent age?
- **Response:**
 - Center:
 - Spread:
 - Shape:

Cengage Learning

Elementary Statistics: Looking at the Big Picture Practice: 5.13b-d p.147 L6.42

Example: Paired vs. Two-Sample Design

- Background: Comparing ages of surveyed students' parents to see if mothers or fathers are older.
- **Questions:**
 - Why is design paired, not two-sample?
 - How to display and summarize relationship between parent sex and parent age?
 - What results would you expect to see?
- **Responses:**
 - Paired because _____
 - Display: Summarize:
 - May suspect tend to be older.

©2011 Brooks/Cole

Elementary Statistics: Looking at the Big Picture Practice: 5.13a p.147

40

Notation

- ☐ Two-sample or Several-Sample Design: extend notation for means and standard deviations with subscript numbers 1, 2, etc.
- □ Paired Design: indicate notation for differences with subscript "d"

@2011 Brooks/Cole Cengage Learning

Example: Notation

- **Background**: For a sample of countries, illiteracy rates are recorded for each gender group.
- **Ouestion:** How do we denote the following?
 - Mean of illiteracy differences for sampled countries
 - Standard deviation of illiteracy differences for the sampled countries
- □ Response: (design)
 - Mean of illiteracy differences for the sampled countries:
 - Standard deviation of illiteracy differences for the sampled countries:

Elementary Statistics: Looking at the Big Picture

L6.47

47

Sample vs. Population Differences

How different are responses for sampled groups?

- □ Centers: First compare means/medians.
- □ **Spreads:** Differences appear more pronounced if values are concentrated around their centers.
- □ Sample Sizes: Differences are more impressive coming from larger samples.

Looking Ahead: Inference comparing means will have us focus on centers, spreads, and sample sizes.

Cengage Learning

Example: More Notation

- □ **Background**: Records are kept concerning percentages of students at all private, state, and staterelated schools receiving Pell grants.
- **Question:** How do we denote the following?
 - Mean percentages for the three types of school
 - Standard deviations of percentages for the three types of school
- **□** Response:
 - Mean %'s for the three types of school:
 - Standard deviations of %'s for the three types of school:

©2011 Brooks/Cole

Elementary Statistics: Looking at the Big Picture Practice: 5.71b p.206

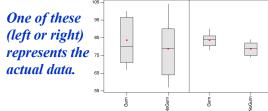

49

Example: Impact of Spreads on Perceived Difference between Means

Background: Experiment compared test scores for gumchewers and non-chewers learning anatomy. Means: 83.6 (chewers), 78.8 (non-chewers)

Scenario B (less spread)

Scenario B (less spread)

- Question: For which scenario (left or right) are you more convinced that chewing gum aids learning?
- **Response:**

Cengage Learning

Elementary Statistics: Looking at the Big Picture Practice: 5.15f p.148

Example: Impact of Sample Size on Perceived Difference between Means

- **Background:** Experiment compared test scores for gum-chewers and non-chewers learning anatomy. Means: 83.6 (chewers), 78.8 (non-chewers)
- Question: Which would convince you more that chewing gum aids learning: if data came from 56 students or 560 students?
- **□** Response:

©2011 Brooks/Cole Cengage Learning Elementary Statistics: Looking at the Big Picture Practice: 5.15h p.148

55

55

Lecture Summary (Normal Distributions)

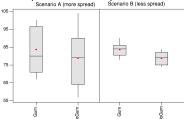

- \Box Standardizing: z=(value-mean)/sd
- \Box 68-95-99.7 Rule: applied to standard scores z
- □ Interpreting Standard Score z
- □ Unstandardizing: x=mean+z(sd)

©2011 Brooks/Col Cengage Learning Elementary Statistics: Looking at the Big Picture

L6.60

Example: Impact of Study Design on Perceived Difference between Means

Background: Experiment compared test scores for gumchewers and non-chewers learning anatomy. Means: 83.6 (chewers), 78.8 (non-chewers)

- Question: Are there concerns about experimenter effect, placebo effect, realism, ethics, compliance?
- □ **Response**: is most worrisome.

©2011 Brooks/Cole Cengage Learning Elementary Statistics: Looking at the Big Picture

L6.58

58

Lecture Summary

(Categorical and Quantitative Relationships)

- ☐ Two- or Several-Sample Design
 - Format: one column for each group or one column for each of two variables
 - **Display:** side-by-side boxplots
 - **Compare:** means and sd's or 5 No. Summaries
- Paired Design:
 - Display: Histogram of differences
 - **Summarize:** Mean and sd of differences
- **Notation:** Design? Sample or population?
- How Different Are Sample Means?
 - Impacted by spreads and sample sizes
