

## Lecture 15: Chapter 7, Section 1 Random Variables

- Definitions, Notation
- Probability Distributions
- Application of Probability Rules
- Mean and s.d. of Random Variables; Rules

## Looking Back: Review

- **4 Stages of Statistics**
  - Data Production (discussed in Lectures 1-4)
  - Displaying and Summarizing (Lectures 5-12)
  - Probability
    - Finding Probabilities (discussed in Lectures 13-14)
    - Random Variables
    - Sampling Distributions
  - Statistical Inference

**Random Variable:** a quantitative variable whose values are results of a random process

**Looking Ahead:** In Inference, we'll want to draw conclusions about population proportion or mean, based on sample proportion or mean. To accomplish this, we will explore how sample proportion or mean behave in repeated samples. If the samples are random, sample proportion or sample mean are **random variables**.

- **Discrete Random Variable:** one whose possible values are finite or countably infinite (like the numbers 1, 2, 3, ...)
- **Continuous Random Variable:** one whose values constitute an entire (infinite) range of possibilities over an interval

## Definition

## Notation

- Random Variables are generally denoted with capital letters such as  $X$ ,  $Y$ , or  $Z$ .  
The letter **Z** is often reserved for random variables that follow a standardized **normal** distribution.

L15.6

Elementary Statistics: Looking at the Big Picture

L15.7

## Example: A Simple Random Variable

- **Background:** Toss a coin twice, and let the random variable  $X$  be the number of tails appearing.
- **Questions:**
  - What are the possible values of  $X$ ?
  - What kind of random variable is  $X$ ?
- **Responses:**
  - Possible values:
    - $X$  is a \_\_\_\_\_

Practice: 7.1a p.285

©2011 Brooks/Cole,  
Cengage Learning

## Definitions

- **Probability distribution** of a random variable tells all of its possible values along with their associated probabilities.
- **Probability histogram** displays possible values of a random variable along horizontal axis, probabilities along vertical axis.

L15.8

Elementary Statistics: Looking at the Big Picture

## Definition

- **Probability distribution** of a random variable tells all of its possible values along with their associated probabilities.
- Looking Back:** Last chapter we considered individual probabilities like the chance of getting two tails in two coin tosses. Now we take a more global perspective, considering the probabilities of all the possible numbers of tails occurring in two coin tosses.

L15.9

Elementary Statistics: Looking at the Big Picture

©2011 Brooks/Cole,  
Cengage Learning

## Median and Mean of Probability Distribution

- **Median** is the middle value, with half of values above and half below (equal area value on histogram)
- **Mean** is average value (“balance point” of histogram)
- **Mean equals Median** for symmetric distributions

©2011 Brooks/Cole,  
Cengage Learning

L15.10

Elementary Statistics: Looking at the Big Picture

## Example: Probability Distribution of a Random Variable

- **Background:** We have the probability distribution of the random variable  $X$  for number of tails in two tosses of a coin.
- **Question:** How do we display and summarize  $X$ ?
- **Response:** Use \_\_\_\_\_.
- Summarize: (center) mean=median=\_\_\_\_\_
- (spread) Typical distance from 1 is a bit less than \_\_\_\_\_.

©2011 Brooks/Cole,  
Cengage Learning

L15.14

Elementary Statistics: Looking at the Big Picture

## Example: Probability Distribution of a Random Variable

- **Background:** The random variable  $X$  is the number of tails in two tosses of a coin.
- **Questions:**
  - What are the probabilities of the possible outcomes?
  - What is the probability distribution of  $X$ ?
- **Responses:** Possible outcomes:
  - Non-overlapping “Or” Rule  $\rightarrow P(X=1) =$

Each has probability \_\_\_\_\_ so the probability distribution is:

$X = \text{Number of tails}$	0	1	2
Probability			

Non-overlapping “Or” Rule  $\rightarrow P(X=1) =$   
©2011 Brooks/Cole,  
Cengage Learning

L15.12

## Notation; Permissible Probabilities and Sum-to-One Rule for Probability Distributions

- $P(X=x)$  denotes the probability that the random variable  $X$  takes the value  $x$ .  
Any probability distribution of a discrete random variable  $X$  must satisfy:
  - $0 \leq P(X=x) \leq 1$  where  $x$  is any value of  $X$
  - $P(X=x_1) + P(X=x_2) + \dots + P(X=x_k) = 1$  where  $x_1, x_2, \dots, x_k$  are all possible values of  $X$
- According to this Rule, if a probability histogram has bars of width 1, their total area must be 1.

Cengage Learning

L15.15

Elementary Statistics: Looking at the Big Picture

## Interim Table

To construct probability distribution for more complicated random processes, begin with **interim table showing all possible outcomes and their probabilities.**

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture  
L15.16

## Example: *Interim Table and Probability Distribution*

- Background:** A coin is tossed 3 times and the random variable  $X$  is number of tails tossed.
- Questions:** What are the possible outcomes, values of  $X$ , and probabilities? How do we find probability that  $X=1$ ?  $X=2$ ?
- Response:**
  - Interim Table:
  - Use \_\_\_\_\_
  - Rule to combine probabilities \_\_\_\_\_

Outcome	$X = \text{no. of tails}$	Probability
HHH	0	1/8
HHT	1	1/8
HTH	1	1/8
THH	1	1/8
HTT	2	1/8
THT	2	1/8
TTH	2	1/8
TTT	3	1/8

Elementary Statistics: Looking at the Big Picture  
*Practice: 7.5a p.286*

©2011 Brooks/Cole,  
Cengage Learning

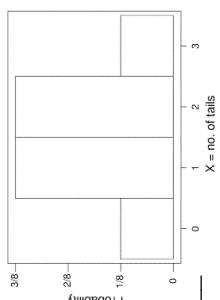

L15.18

## Example: *Probability Distribution and Histogram*

- Background:**  $X$  is number of tails in 3 coin tosses.
- Question:** What are the probability distribution of  $X$  and probability histogram?
- Response:** Use the interim table to determine probabilities.

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture  
*Practice: 7.5a-b p.286*

L15.20

- Typical distance from mean a bit less than \_\_\_\_\_ since 1 and 2 (which are more common) are only \_\_\_\_\_ away from 1.5; 0 and 3 (less common) are \_\_\_\_\_ away from 1.5.

**Looking Ahead:**  
Standard deviation of R.V. to be introduced later on

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture  
*Practice: 7.5c p.286*

L15.22

Elementary Statistics: Looking at the Big Picture  
*Practice: 7.5c p.286*

L15.22

## Definition (Review)

- **Probability:** chance of an event occurring, determined as the
    - Proportion of **equally likely outcomes** comprising the event; or
    - Proportion of outcomes observed in the long run that comprised the event; or
    - Likelihood of occurring, assessed **subjectively**.
- Looking Back:** Principle of *equally likely outcomes* was used to establish coin-flip probabilities. For other R.V.s, like household size, the distribution has been constructed for us based on **long-run observations**.

L15.23

Elementary Statistics: Looking at the Big Picture  
©2011 Brooks/Cole,  
Cengage Learning

## Example: Different Ways to Assess Probabilities

- **Background:** Census Bureau reported distribution of U.S. household size in 2000.

$P(X = x)$	X	1	2	3	4	5	6	7
0.26	0.34	0.16	0.14	0.07	0.02	0.01		
- **Question:** What is the difference between how these probabilities have been assessed, and the way we assessed probabilities for coin-flip examples?
- **Response:** Coin-flip probabilities are based on \_\_\_\_\_ (two equally likely faces).  
Household probabilities are based on \_\_\_\_\_ (all households in U.S. in 2000).

Elementary Statistics: Looking at the Big Picture  
*Practice: 7.7b p.287*  
L15.25

Cengage Learning

## Probability Rules (Review)

Probabilities must obey

- Permissible Probabilities Rule
- Sum-to-One Rule
- “Not” Rule
- Non-Overlapping “Or” Rule
- Independent “And” Rule
- General “Or” Rule
- General “And” Rule
- Rule of Conditional Probability

L15.26

Elementary Statistics: Looking at the Big Picture  
©2011 Brooks/Cole,  
Cengage Learning

## Example: Permissible Probabilities Rule

- **Background:** Household size in U.S. has

$P(X = x)$	X	1	2	3	4	5	6	7
0.26	0.34	0.16	0.14	0.07	0.02	0.01		
- **Question:** How do these probabilities conform to the **Permissible Probabilities Rule**?
- **Response:**

Elementary Statistics: Looking at the Big Picture  
L15.28

©2011 Brooks/Cole,  
Cengage Learning

## Example: *Sum-to-One Rule*

- Background:** Household size in U.S. has

$X$	1	2	3	4	5	6	7
$P(X = x)$	0.26	0.34	0.16	0.14	0.07	0.02	0.01

- Question:** According to the “*Sum-to-One Rule*”, what must be true about the probabilities in the distribution?

- Response:** According to the Rule, we have

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture  
L15.30

## Example: “Not” Rule

- Background:** Household size in U.S. has

$X$	1	2	3	4	5	6	7
$P(X = x)$	0.26	0.34	0.16	0.14	0.07	0.02	0.01

- Question:** According to the “*Not*” Rule, what is the probability of a household *not* consisting of just one person?

- Response:**

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture  
L15.32

## Example: *Independent “And” Rule*

- Background:** Household size in U.S. has

$X$	1	2	3	4	5	6	7
$P(X = x)$	0.26	0.34	0.16	0.14	0.07	0.02	0.01

- Question:** Suppose a polling organization has sampled two households at random. According to the *Independent “And” Rule*, what is the probability that the first has 3 people and the second has 4 people?

- Response:** The probability that the first has 3 people and the second has 4 people is

$$P(X_1=3 \text{ and } X_2=4)$$

= \_\_\_\_\_  
where we use  $X_1$  to denote number in 1<sup>st</sup> household,  
 $X_2$  to denote number in 2<sup>nd</sup> household.

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture  
Practice: 7.8e p.287  
L15.36

## Example: *Non-Overlapping “Or” Rule*

- Background:** Household size in U.S. has

$X$	1	2	3	4	5	6	7
$P(X = x)$	0.26	0.34	0.16	0.14	0.07	0.02	0.01

- Question:** According to the *Non-overlapping “Or” Rule*, what is the probability of having fewer than 3 people?

- Response:** The probability of having fewer than 3 people is  $P(X < 3)$

$$= _____$$

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture  
Practice: 7.8a-b p.287  
L15.34

## Example: General “Or” Rule

- Background: Household size in U.S. has

$X$	1	2	3	4	5	6	7
$P(X = x)$	0.26	0.34	0.16	0.14	0.07	0.02	0.01

- Question: Suppose a polling organization has sampled two households at random. According to the General “Or” Rule, what is the probability that one or the other has 3 people?
- Response: The events **overlap**: it is possible that both households have 3 people.  $P(X_1=3 \text{ or } X_2=3) =$  \_\_\_\_\_

where we apply the Independent “And” Rule for  $P(X_1=3 \text{ and } X_2=3)$ .

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture Practice: 7.8 p.287 L15.41

## Example: Rule of Conditional Probability

- Background: Household size in U.S. has

$X$	1	2	3	4	5	6	7
$P(X = x)$	0.26	0.34	0.16	0.14	0.07	0.02	0.01

- Question: Suppose a polling organization samples only from households with fewer than 3 people. What is the probability that a household with fewer than 3 people has only 1 person?

- Response:

$$P(X=1 \text{ given } X < 3) =$$

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture Practice: 7.8 p.287 L15.41

## Mean and Standard Deviation of Random Variable

- Mean of discrete random variable  $X$

$$\mu = x_1 P(X = x_1) + \dots + x_k P(X = x_k)$$

Mean is **weighted average** of values, where each value is weighted with its probability.

- Standard deviation of discrete random variable  $X$

$$\sigma = \sqrt{(x_1 - \mu)^2 P(X = x_1) + \dots + (x_k - \mu)^2 P(X = x_k)}$$

Standard deviation is “typical” distance of values from mean. Squared standard deviation is the **variance**.

**Looking Back:** Greek letters are used because *these are the mean and standard deviation of all the random variables’ values.*

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture Practice: 7.10g-h p.288 L15.41

## Example: Mean of Random Variable

- Background: Household size in U.S. has

$X$	1	2	3	4	5	6	7
$P(X = x)$	0.26	0.34	0.16	0.14	0.07	0.02	0.01

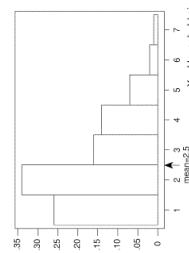

- Question: What is the mean household size?
  - Response:  $1(0.26)+2(0.34)+\dots+7(0.01) =$  \_\_\_\_\_ is the mean household size.

**Looking Back:** Median is 2 (has 0.5 at or below it). Mean is greater than median because distribution is skewed right. Also, mean is less than the “middle” number, 4, because smaller household sizes are weighted with higher probabilities.

©2011 Brooks/Cole,  
Cengage Learning  
Elementary Statistics: Looking at the Big Picture Practice: 7.10g-h p.288 L15.41

## Example: Standard Deviation of R.V.

- Background:** Household size in U.S. has
  - |          |      |      |      |      |      |      |      |
|----------|------|------|------|------|------|------|------|
| X        | 1    | 2    | 3    | 4    | 5    | 6    | 7    |
| $P(X=x)$ | 0.26 | 0.34 | 0.16 | 0.14 | 0.07 | 0.02 | 0.01 |
  - Question:** What is the standard deviation of household sizes (typical distance from the mean, 2.5)?
    - (a) 0.014 (b) 0.14 (c) 1.4 (d) 14.0
  - Response:** The typical distance of household sizes from their mean, 2.5, is \_\_\_\_\_: the closest are 0.5 away (2 and 3), the farthest is 4.5 away (7). (Or calculate by hand or with software).
- A Closer Look:** Skewed right → most of the spread arises from values above the mean, not below.
- ©2011 Brooks/Cole, Cengage Learning  
Elementary Statistics: Looking at the Big Picture Practice: 7.15 p.288 L15.48

Standard deviation = \_\_\_\_\_

## Rules for Mean and Variance

- Multiply R.V. by constant → its mean and standard deviation are multiplied by same constant [or its abs. value, since s.d. $>0$ ]
- Take sum of two independent R.V.s →
  - mean of sum = sum of means
  - variance of sum = sum of variances (variance is squared standard deviation)

**Looking Ahead:** These rules will help us identify mean and standard deviation of sample proportion and sample mean.

L15.46

Elementary Statistics: Looking at the Big Picture

©2011 Brooks/Cole, Cengage Learning

## Example: Mean, Variance, and SD of R.V.

- Background:** Number  $X$  rolled on a die has

X=no. rolled	1	2	3	4	5	6
$P(X=x)$	1/6	1/6	1/6	1/6	1/6	1/6

- Question:** What are the mean, variance, and standard deviation of  $X$ ?

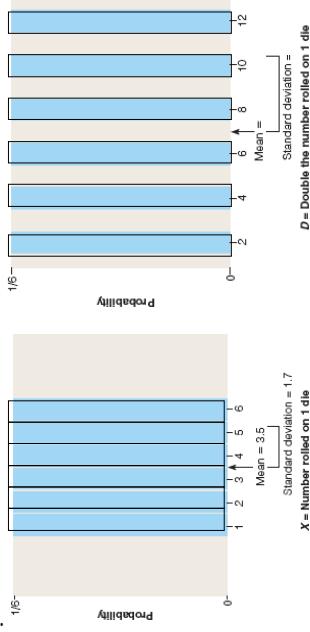

### Response:

- Mean:** same as median \_\_\_\_\_ (because symmetric)
- Variance:** \_\_\_\_\_ (found by hand or with software)
- Standard deviation:** \_\_\_\_\_ (square root of variance)

©2011 Brooks/Cole, Cengage Learning  
Elementary Statistics: Looking at the Big Picture Practice: 7.12 p.288 L15.48

## Example: Mean and SD for Multiple of R.V.

- Background:** Number  $X$  rolled on a die has mean 3.5, s.d. 1.7.

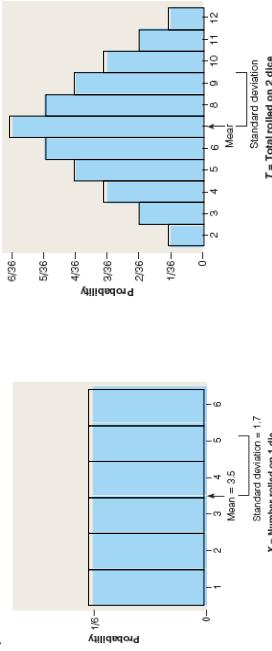

- Question:** What are mean and s.d. of double the roll?
- Response:** For double the roll, mean is \_\_\_\_\_, s.d. is \_\_\_\_\_

©2011 Brooks/Cole, Cengage Learning  
Elementary Statistics: Looking at the Big Picture Practice: 7.15 h-p.289 L15.49

## Example: Mean and SD for Sum of R.V.s

- **Background:** Numbers  $X_1, X_2$  on 2 dice each have mean 3.5, variance 2.92.

- **Question:** What are mean, variance, and s.d. of total on 2 dice?

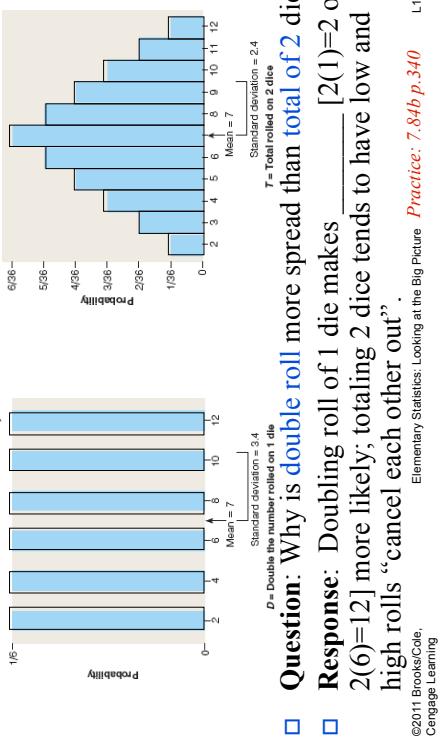

- **Response:** Mean \_\_\_\_\_, variance \_\_\_\_\_, s.d. \_\_\_\_\_
- **Question:** Why is double roll more spread than total of 2 dice?
- **Response:** Doubling roll of 1 die makes \_\_\_\_\_ [2(1)=2 or 2(6)=12] more likely; totaling 2 dice tends to have low and high rolls “cancel each other out”.

©2011 Brooks/Cole,  
Cengage Learning

Elementary Statistics: Looking at the Big Picture Practice: 7.84 b p.340 L15.54

## Example: Doubling R.V. or Adding Two R.V.s

- **Background:** Double roll of a die: mean=7, s.d.=3.4.
- Total of 2 dice: mean=7, s.d.=2.4.

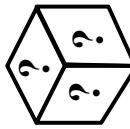

- **Question:** Why is double roll more spread than total of 2 dice?
- **Response:** Doubling roll of 1 die makes \_\_\_\_\_ [2(1)=2 or 2(6)=12] more likely; totaling 2 dice tends to have low and high rolls “cancel each other out”.

©2011 Brooks/Cole,  
Cengage Learning

Elementary Statistics: Looking at the Big Picture Practice: 7.84 b p.340 L15.54

## Example: Doubling R.V. or Adding Two R.V.s

- This is the key to the benefits of sampling many individuals: **The average of their responses gets us closer to what's true for the larger group.**
- If the numbers on a die were unknown, and you had to guess their mean value, would you make a better guess with a single roll or the average of two rolls?

## Lecture Summary (Random Variables)

- Random variables
  - Discrete vs. continuous
  - Notation
- Probability distributions: displaying, summarizing
- Probability rules applied to random variables
- Constructing distribution table
- Mean and standard deviation of random variable
- Rules for mean and variance
